0.1 Defining Vector Spaces and Subspaces

We've seen the sets \mathbb{R}^2 and \mathbb{R}^3 where the elements are vectors as translations in plane and 3-space. These sets have an algebraic structure.

Definition (Vector Space):

Any set following axioms A1-A10 is called a **vector space**.

Given a vector space A, vectors $u, v, w \in A$ and scalars r, s:

- A1. We can define addition (and the space is closed under addition).
- A2. We can define scalar multiplication (and the space is closed under scalar multiplication).
- A3. u + v = v + u
- A4. (u+v) + w = u + (v+w)
- A5. There exists an additive identity in A.
- A6. There exists an additive inverse for any $u \in A$.
- A7. There exists a multiplicative identity in A.
- A8. (rs)v = r(sv)
- A9. r(u+v) = ru + rv
- A10. (r+s)v = rv + sv

By studying vector spaces, we can develop algebraic machinery to apply to all kinds of other objects. For example, this idea will be explored for Fourier series.

Example:

$$Q = \{a_0 + a_1x + a_2x^2 \mid a_i \in \mathbb{R}\}$$
 (Polynomials of degree 2 or less)

This is a vector space!

- A1. Adding doesn't increase the degree. \checkmark
- A2. Scalar multiplication similarly doesn't increase the degree. \checkmark
- A3. Addition in \mathbb{R} is commutative. \checkmark
- A4. By the associative property of \mathbb{R} ,

$$((a_0 + a_1x + a_2x^2) + (b_0 + b_1x + b_2x^2)) + (c_0 + c_1x + c_2x^2)$$

$$= ((a_0 + b_0) + c_0) + ((a_1 + b_1) + c_1)x + ((a_2 + b_2) + c_2)x^2$$

$$= (a_0 + (b_0 + c_0)) + (a_1 + (b_1 + c_1))x + (a_2 + (b_2 + c_2))x^2$$

$$= a_0 + a_1x + a_2x^2 + (b_0 + c_0) + (b_1 + c_1)x + (b_2 + c_2)x^2 \checkmark$$

A5. 0 polynomial \checkmark

A6.
$$-(a_0 + a_1x + a_2x^2) = -a_0 - a_1x - a_2x^2$$

A7.
$$1 \cdot (a_0 + a_1 x + a_2 x^2) = a_0 + a_1 x + a_2 x^2 \checkmark$$

Example:

$$V = \mathbb{R}^2$$

$$S = \{(x, y) \mid x^2 - y^2 = 0\}$$

Is S a vector space?

No, since addition is not closed.

Example:

$$V = M_{3\times 2}(\mathbb{R}) = \left\{ \begin{bmatrix} a & d \\ b & e \\ c & f \end{bmatrix} \middle| a, b, c, d, e, f \in \mathbb{R} \right\}$$

 $S = \{A \in V \mid \text{columns each sum to } 0\}$

Is S a vector space?

For example,
$$\begin{bmatrix} 1 & 0 \\ 0 & 2 \\ -1 & -2 \end{bmatrix} \in S. \text{ Now, } \vec{0} = \begin{bmatrix} 0 & 0 \\ 0 & 0 \\ 0 & 0 \end{bmatrix}.$$

Closed under scalar mult? ✓

Consider
$$\begin{bmatrix} a & d \\ b & e \\ c & f \end{bmatrix}$$
 s.t. $a + b + c = 0$ and $d + e + f = 0$.
Then $m \begin{bmatrix} a & d \\ b & e \\ c & f \end{bmatrix} = \begin{bmatrix} ma & md \\ mb & me \\ mc & mf \end{bmatrix}$.

Then
$$m \begin{bmatrix} a & d \\ b & e \\ c & f \end{bmatrix} = \begin{bmatrix} ma & md \\ mb & me \\ mc & mf \end{bmatrix}$$

So
$$ma + mb + mc = m(a + b + c) = m(0)$$
 and $md + me + mf = m(d + e + f) = m(0)$.

Closed under addition

Consider
$$\begin{bmatrix} a & d \\ b & e \\ c & f \end{bmatrix}$$
, $\begin{bmatrix} a' & d' \\ b' & e' \\ c' & f' \end{bmatrix} \in S$.

Now $\begin{bmatrix} a & d \\ b & e \\ c & f \end{bmatrix} + \begin{bmatrix} a' & d' \\ b' & e' \\ c' & f' \end{bmatrix} = \begin{bmatrix} a+a' & d+d' \\ b+b' & e+e' \\ c+c' & f+f' \end{bmatrix}$

Check $(a+a') + (b+b') + (c+c') = (a+b+c) + (a'+b'+c') = 0$.

Note. Since the above examples of S are subsets of known vector spaces, we just have to check:

- 1. Closed under +, -
- 2. Closed under scalar multiplication

3

These are called **subspaces**.

Vectors spaces do not just include \mathbb{R}^n and \mathbb{C}^n . We have:

- $C^k(I)$: function on an internal I with k continuous derivatives
- $P_n(\mathbb{R})$: polynomials with degree up to n
- $M_{m \times n}(\mathbb{R})$

Example:

Consider $y'' + a_1(x)y' + a_2(x) = 0$ on an interval I. Let S be the set of solutions to this LODE. Is S a vector space?

• Addition: If $y_1, y_2 \in S$, is $y_1 + y_2 \in S$?

$$(y_1+y_2)''+a_1(x)(y_1+y_2)'+a_2(x)(y_1+y_2) = y_1''+y_2''+a_1(x)(y_1'+y_2')+a_2(x)(y_1+y_2) = 0+0$$

Therefore, S is closed under addition.

• Scalar Multiplication: If $y \in S$, is $cy \in S$? Yes since (cy)'' = cy'' and (cy)' = cy'.

Therefore S is a vector space, a subspace of $C^2(I)$.

Example:

Let $V = \mathbb{R}^3$ and S be the solutions to the linear system:

$$2x + 3y + z = 0$$

$$x + 2y + 3z = 0$$

Then $S \subset V$ is a subspace. All vectors in the subspace lie on a line through the origin contained on both planes.

Using this concept of subspaces, we can find solutions to certain differential equations or systems of linear equations.

Definition (Null Space):

The solutions of a homogeneous linear system $A\vec{x} = 0$ is called the **null space** of A, any $A_{m \times n}$. It is a subspace of \mathbb{R}^n and is also known as the **kernel** of A.

For \mathbb{R}^3 , subspaces consist of either a point $\vec{0}$, a line through $\vec{0}$, or a plane through $\vec{0}$.

0.2 Spanning Sets

Definition (Span):

A linear combination of vectors $\vec{v_1}, \vec{v_2}, \dots, \vec{v_n} \in V$ is a vector $\vec{v} = c_1 \vec{v_1} + c_2 \vec{v_2} + n \vec{v_n}$ in V.

The **span** of $\{\vec{v_1}, \vec{v_2}, \dots, \vec{v_n}\}$ is the set of all linear combinations. The span is a subspace of the vector space V.

Example:

Compute the span of $\{(-4,1,3), (5,1,6), (6,0,2)\}$ in \mathbb{R}^3 .

We want the set $\{(a, b, c)\}$ that are linear combinations of the three vectors. In other words, the solutions of the linear system:

$$\begin{bmatrix} -4 & 5 & 6 & a \\ 1 & 1 & 0 & b \\ 3 & 6 & 2 & c \end{bmatrix}$$

- 1. P_{12}
- $2. A_{12}(4)$
- 3. $A_{13}(-3)$
- 4. P_{23}
- 5. $A_{23}(-3)$

There is a solution if and only if $rkA = rkA^{\#}$. So a + 13b - 3c = 0. We conclude the span is on a plane x + 13y - 3z = 0.

Note. One of the three vectors is redundant.

Example:

Write (-4, 1, 3) as a linear combination of (5, 1, 6) and (6, 0, 2).

We want constants c_1, c_2 such that:

$$c_1 \begin{bmatrix} 5 \\ 1 \\ 6 \end{bmatrix} + c_2 \begin{bmatrix} 6 \\ 0 \\ 2 \end{bmatrix} = \begin{bmatrix} -4 \\ 1 \\ 3 \end{bmatrix}$$

We need to solve $\begin{bmatrix} 5 & 6 & -4 \\ 1 & 0 & 1 \\ 6 & 2 & 3 \end{bmatrix}$

$$\xrightarrow{\frac{1}{2.3.}} \begin{bmatrix} 1 & 0 & 1 \\ 0 & 6 & -9 \\ 0 & 2 & -3 \end{bmatrix} \xrightarrow{4.5.} \begin{bmatrix} 1 & 0 & 1 \\ 0 & 2 & -3 \\ 0 & 0 & 0 \end{bmatrix} \xrightarrow{6.} \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & \frac{-3}{2} \\ 0 & 0 & 0 \end{bmatrix}$$

Thus
$$\begin{bmatrix} 5\\1\\6 \end{bmatrix} - \frac{3}{2} \begin{bmatrix} 6\\0\\2 \end{bmatrix} = \begin{bmatrix} -4\\1\\3 \end{bmatrix}.$$

The moral of this example is that sometimes a spanning set has redundant vectors. We would like a spanning set to have no redundant vectors or a "minimally spanning set."

Definition (Linear Dependence):

A set $\{\vec{v_1}, \vec{v_2}, \dots, \vec{v_n}\}$ in a vector space V is **linearly dependent** if there exists some c_1, c_2, \dots, c_n not all zero such that: $c_1\vec{v_1} + c_2\vec{v_2} + \dots + c_n\vec{v_n} = \vec{0}$. (This is called the dependence relation, and we would say one of the vectors is redundant.)

Otherwise, the set is **linearly independent** and the relation $c_1\vec{v_1} + c_2\vec{v_2} + \cdots + c_n\vec{v_n} = \vec{0}$ implies $c_1 = c_2 = \cdots = c_n = 0$.

Example:

The vectors
$$\vec{v_1} = \begin{bmatrix} 2 \\ -1 \\ 1 \end{bmatrix}$$
, $\vec{v_2} = \begin{bmatrix} -1 \\ 2 \\ -1 \end{bmatrix}$, $\vec{v_3} = \begin{bmatrix} -1 \\ -1 \\ 2 \end{bmatrix}$ are linearly dependent.

Find the dependence relation

We need to solve $A\vec{x} = \vec{0}$ and $\text{rk}A \leq 2$ for there to be nontrivial solutions.

$$\begin{bmatrix} 2 & -1 & -1 & 0 \\ -1 & 2 & -1 & 0 \\ -1 & -1 & 2 & 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & -2 & 0 \\ 0 & 3 & -3 & 0 \\ 0 & -3 & 3 & 0 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 1 & -2 & 0 \\ 0 & 1 & -1 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}$$

Parameterizing, we find that $c_3 = t$, $c_2 = t$, $c_1 = 2t - t = t$.

Therefore $\vec{v_1} + \vec{v_2} + \vec{v_3} = \vec{0}$.

0.2.1 Method for Testing Spans

Given $\{\vec{v_1}, \ldots, \vec{v_n}\}$, to determine if they are linearly dependent, form a matrix

$$A = \begin{bmatrix} \vec{v_1} \ \vec{v_2} \ \dots \ \vec{v_n} \end{bmatrix}$$

Then the set is linearly dependent if and only if $A\vec{c} = \vec{0}$ has nontrivial solutions. In other words, there exists some non-zero scalars c_1, \ldots, c_k such that $c_1\vec{v_1} + \cdots + c_k\vec{v_k} = \vec{0}$ if and only if $\mathrm{rk}A < k$.

The technique is to commit ERO's and find rref(A).

For example, suppose we have a span and $\operatorname{rref}(A^{\#})$ is:

$$\begin{bmatrix} 1 & 2 & 0 & 3 & 0 & 0 \\ 0 & 0 & 1 & 4 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

We have two free variables.

Claim: Each free variable gives a nontrivial dependence with bound variables.

So for this example, there are two dependence relations where $\vec{v_2}$ and $\vec{v_4}$ are redundant and $\vec{v_1}$, $\vec{v_3}$, $\vec{v_5}$ form a linearly independent span.

In general, we can conclude that $v_1, \ldots, \vec{v_k}$ are linearly independent if and only if there are no free variables in $\operatorname{rref}(A^{\#})$ or equivalently $\operatorname{rk} A = k$.

Theorem 1. In \mathbb{R}^n , a set $\{\vec{v_1}, \ldots, \vec{v_n}\}$ is linearly independent if and only if, for the matrix $A = [\vec{v_1}, \ldots, \vec{v_n}]$, det $A \neq 0$ or $rrefA = I_n$.

Example:

Find all values of k such that: $\{(1,1,0,-1), (1,k,1,1), (2,1,k,1), (-1,1,1,k)\}$ are linearly independent.

Applying the previous theorem, the solution form is:

$$\begin{bmatrix} 1 & 1 & 2 & -1 \\ 1 & k & 1 & 1 \\ 0 & 1 & k & 1 \\ -1 & 1 & 1 & k \end{bmatrix} \begin{bmatrix} c_1 \\ c_2 \\ c_3 \\ c_4 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

Then det $A = k^3 - 2k^2 - 5k + 6 = (k-1)(k+2)(k-3)$. We conclude $k \neq -2, 1, -3$.

0.3 Linear Independence of Functions

Definition (Wronskian):

Let f_1, f_2, \ldots, f_n be in $C^{n=1}(I)$. The Wronskian is:

$$W[f_1, f_2, \dots, f_n] = \begin{vmatrix} f_1 & f_2 & \dots & f_n \\ f_1 & f_2 & \dots & f_n \\ \vdots & \vdots & \ddots & \vdots \\ f_1 & f_2 & \dots & f_n \end{vmatrix}$$

Then if $W[f_1, f_2, \ldots, f_n](x) \neq 0$ for some $x \in I$, then the functions are linearly independent.

Sketch (of Proof)

The dependence relation has the form:

$$c_1 f_1 + c_2 f_2 + \dots + c_n f_n = 0$$
 for all x

This implies:

$$c_1 f_1' + c_2 f_2' + \dots + c_n f_n' = 0$$
 for all x

and so on, ending with

$$c_1 f_1^{n-1} + c_2 f_2^{n-1} + \dots + c_n f_n^{n-1} = 0$$
 for all x

We conclude that $W[f_1, f_2, \ldots, f_n](x) = 0$ for all x.

Therefore if $W[f_1, f_2, \ldots, f_n](x) \neq 0$, then $c_1 f_1 + c_2 f_2 + \cdots + c_n f_n \neq 0$ for some x.

Example (Exponentials):

Determine whether e^x and e^{-x} are linearly independent on $(-\infty, \infty)$.

$$W[e^x, e^{-x}] = \begin{vmatrix} e^x & e^{-x} \\ e^x & -e^{-x} \end{vmatrix} = -1 - 1 = -2$$

We conclude they are linearly independent on $(-\infty, \infty)$.

What about e^x and e^{2x} ?

$$W[e^x, e^{2x}] = \begin{vmatrix} e^x & e^{2x} \\ e^x & 2e^{2x} \end{vmatrix} = e^{3x} \neq 0$$

We also conclude they are linearly independent.

Example $(P_2(x))$:

Determine the linear independence of $\{1, x, x^2\}$.

$$W[1, x, x^{2}] = \begin{vmatrix} 1 & x & x^{2} \\ 0 & 1 & 2x \\ 0 & 0 & 2 \end{vmatrix} = 2$$

Therefore, $\{1, x, x^2\}$ are linearly independent.

What about $\{1, x, x^2\}$?

$$W[1, x, 2x] = \begin{vmatrix} 1 & x & 2x \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{vmatrix} = 0$$

We cannot draw a conclusion soley on the Wronskian, but look:

$$c_1 \cdot 1 + c_2 \cdot x + c_3 \cdot 2x = 0$$

$$c_1 = 0, c_2 = -2, c_3 = 1$$

Therefore, $\{1, x, x^2\}$ are linearly dependent.

0.4 Bases and Dimensions

Definition (Basis):

A **basis** for a vector space V is a set of vectors that:

- 1. span V.
- 2. are linearly independent.

Example:

In
$$\mathbb{R}^3$$
, the standard basis is: $\left\{ \begin{bmatrix} 1\\0\\0 \end{bmatrix}, \begin{bmatrix} 0\\1\\0 \end{bmatrix}, \begin{bmatrix} 0\\0\\1 \end{bmatrix} \right\}$.

In P_2 , the standard basis is: $\{1, x, x^2\}$.

Note. These are not unique. (We can write multiple bases.)

Theorem 2. Any two bases for V have the same number of vectors (assuming they are finite).

Sketch of Proof

If we had two bases:

$$\{\vec{v_1}, \ldots, \vec{v_m}\}, \{\vec{w_1}, \ldots, \vec{w_n}\}$$

Let say that $m \leq n$ and $A = [\vec{v_1}, \dots, \vec{v_m}]$. Now $A\vec{c} = \vec{w_j}$ has unique solutions for all j since $\vec{v_i}$ span V. Since A has m columns, By Thm. of Rank, $rkA = rk(A^{\#}) = n$. *Finish*

Thus, from the previous theorem, we can define the following.

Definition (Dimension):

The **dimension** of a vector space V is the number of elements in any basis.

Example:

Find a basis for the subspace of \mathbb{R}^4 spanned by:

$$\begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 2 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 3 \\ 4 \\ 5 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 0 \\ 1 \\ 0 \end{bmatrix}$$

We can simply choose the underlined vectors. The dimension of this subspace is 3.

0.4.1 Secret Trick

Given a $m \times n$ matrix A, it is useful to know:

- A basis for im(A).
- A basis for ker(A) = null(A).
- A basis for the solution space for the linear system, Ac = 0.

This section will detail a shorthand method to find all these bases quickly.

Let $A = \begin{bmatrix} v_1 & v_2 & \dots & v_n \end{bmatrix}$, an $m \times n$ matrix. First, compute $\operatorname{rref}(A)$ in the usual way. Suppose:

$$\operatorname{rref}(A) = \begin{bmatrix} 0 & 1 & b_{13} & 0 & b_{15} & 0 \\ 0 & 0 & 0 & 1 & b_{25} & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

The free-variable columns correspond to redundant vectors. The bound-variable columns correspond to a basis of the span. Here, \mathbf{v}_1 , \mathbf{v}_3 , and \mathbf{v}_5 are redundant vectors, and $\{\mathbf{v}_2, \mathbf{v}_4, \mathbf{v}_6\}$ are a basis for $\mathrm{im}(A)$.

The dependence-relation vector \mathbf{c}_j corresponding to each free-variable column can be constructed by:

- 1. Put 1 into the j-th spot.
- 2. If $b_{ij} \neq 0$, and the leading 1 is in the *i*-th row is in column k < j, put $-b_{ij}$ in the *k*-th spot.
- 3. Put 0's everywhere else.

Here,
$$\mathbf{c}_1 = \langle 1, 0, 0, 0, 0, 0 \rangle$$
, $\mathbf{c}_3 = \langle 0, -b_{13}, 1, 0, 0, 0 \rangle$, $\mathbf{c}_5 = \langle 0, -b_{15}, 0, -b_{25}, 1, 0 \rangle$

Recall that the solution space is equivalent to ker(A) = null(A).

Example:

Let
$$A = \begin{bmatrix} 1 & 2 & 3 & 2 & 3 \\ 3 & 6 & 9 & 6 & 2 \\ 1 & 2 & 4 & 1 & 2 \\ 2 & 4 & 9 & 1 & 2 \end{bmatrix}$$
. Find bases for the Im A and ker A .

Now rref(A) =
$$\begin{bmatrix} 1 & 2 & 0 & 5 & 0 \\ 0 & 0 & 1 & -1 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}.$$

Applying the secret trick ...

A basis for Im A is
$$\left\{ \begin{bmatrix} 1\\3\\1\\2 \end{bmatrix}, \begin{bmatrix} 3\\9\\4\\9 \end{bmatrix}, \begin{bmatrix} 1\\3\\2\\2 \end{bmatrix} \right\}$$
.

$$\begin{bmatrix} 1 & 2 & 0 & 5 & 0 \\ 0 & 0 & 1 & -1 & 0 \\ 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

A basis for $\ker A$ is
